## **LOGICAL REASONING AND KNOWLEDGE-BASED AGENTS**

### **INTRODUCTION**

Artificial Intelligence (AI) systems can use knowledge representation and logical reasoning to make decisions from available facts and rules. This assessment focuses on four important AI applications: a Smart Medical Diagnosis System, an Autonomous Traffic Management Agent, an Agricultural Expert Reasoning System, and a Wumpus World Knowledge Agent. The problems demonstrate the use of propositional logic, First-Order Logic (FOL), unification, forward chaining, backward chaining, CNF conversion, and resolution.

### **CASE STUDY 1 – SMART MEDICAL DIAGNOSIS SYSTEM**

#### **Problem Statement**

A hospital is designing a rule-based logical agent for preliminary patient diagnosis. The system uses symptoms and medical rules to identify possible diseases.

#### **Knowledge Base**

1. If a patient has Fever AND Cough  $\rightarrow$  Possible Flu.
2. If a patient has Fever AND Rash  $\rightarrow$  Possible Measles.
3. If a patient has Cough AND Breathlessness  $\rightarrow$  Possible Pneumonia.

#### **Facts about Patient A**

- Fever = True
- Cough = True
- Breathlessness = True

#### **(a) Propositional Logic Representation**

Let:

- F = Fever
- C = Cough

- R = Rash
- B = Breathlessness
- Flu = Flu
- Measles = Measles
- Pneumonia = Pneumonia

Rules:

1.  $F \wedge C \rightarrow \text{Flu}$
2.  $F \wedge R \rightarrow \text{Measles}$
3.  $C \wedge B \rightarrow \text{Pneumonia}$

Facts:

$F = \text{True}, C = \text{True}, B = \text{True}.$

### **(b) Forward Chaining**

Starting facts are Fever, Cough, and Breathlessness.

From Rule 1:

$F \wedge C \rightarrow \text{Flu}$

Since Fever and Cough are true:

**Flu = True**

From Rule 2:

$F \wedge R \rightarrow \text{Measles}$

Rash is not available, so Measles cannot be derived.

From Rule 3:

$C \wedge B \rightarrow \text{Pneumonia}$

Since Cough and Breathlessness are true:

**Pneumonia = True**

### **Result**

The possible diagnoses are:

- Flu – True
- Pneumonia – True
- Measles – Not derivable

### **(c) Backward Chaining for Pneumonia**

The goal is:

#### **Pneumonia**

The rule producing Pneumonia is:

$\text{Cough} \wedge \text{Breathlessness} \rightarrow \text{Pneumonia}$

The system checks whether Cough and Breathlessness are facts. Both are true.

Therefore:

**Pneumonia is proved.**

## **CASE STUDY 2 – AUTONOMOUS TRAFFIC MANAGEMENT AGENT**

### **Problem Statement**

A smart city traffic controller uses a First-Order Logic knowledge base to manage emergency vehicle routing. It determines whether vehicles can proceed based on emergency status, clear paths, traffic signals, and vehicle positions.

### **Rules**

1.  $\text{Vehicle}(x) \wedge \text{EmergencyType}(x) \rightarrow \text{ClearPath}(x)$
2.  $\text{ClearPath}(x) \rightarrow \text{GreenSignal}(x) \wedge \neg \text{RedSignal}(x)$
3.  $\text{Vehicle}(x) \wedge \text{Behind}(x,y) \wedge \text{GreenSignal}(y) \rightarrow \text{Proceed}(x)$

### **Facts**

- $\text{Vehicle}(\text{Ambulance})$
- $\text{EmergencyType}(\text{Ambulance})$
- $\text{Vehicle}(\text{CarA})$
- $\text{Behind}(\text{CarA}, \text{Ambulance})$

### **(a) Unification**

Consider Rule 1:

$\text{Vehicle}(x) \wedge \text{EmergencyType}(x) \rightarrow \text{ClearPath}(x)$

Match:

$\text{Vehicle}(x)$

with:

$\text{Vehicle}(\text{Ambulance})$

Therefore:

**$x = \text{Ambulance}$**

The substitution is:

**$\theta = \{x/\text{Ambulance}\}$**

Since  $\text{EmergencyType}(\text{Ambulance})$  is also a fact, the rule produces:

**$\text{ClearPath}(\text{Ambulance})$**

**(b) Resolution Proof**

Convert Rule 1 into CNF:

**$\neg \text{Vehicle}(x) \vee \neg \text{EmergencyType}(x) \vee \text{ClearPath}(x)$**

Rule 2 gives:

**$\neg \text{ClearPath}(x) \vee \text{GreenSignal}(x)$**

and

**$\neg \text{ClearPath}(x) \vee \neg \text{RedSignal}(x)$**

Rule 3 becomes:

**$\neg \text{Vehicle}(x) \vee \neg \text{Behind}(x,y) \vee \neg \text{GreenSignal}(y) \vee \text{Proceed}(x)$**

To prove  $\text{Proceed}(\text{CarA})$ , negate the goal:

**$\neg \text{Proceed}(\text{CarA})$**

From the facts:

$\text{Vehicle}(\text{Ambulance})$  and  $\text{EmergencyType}(\text{Ambulance})$

we derive:

**$\text{ClearPath}(\text{Ambulance})$**

Then:

### **GreenSignal(Ambulance)**

We already know:

- Vehicle(CarA)
- Behind(CarA, Ambulance)

Therefore Rule 3 gives:

### **Proceed(CarA)**

This contradicts the negated goal  $\neg \text{Proceed}(\text{CarA})$ . Hence the empty clause is obtained.

### **Conclusion**

**Proceed(CarA) is logically proved by resolution.**

### **(c) Simultaneous Emergency Vehicles**

The rules are general and can handle multiple emergency vehicles because variables are used. However, the current knowledge base contains emergency information only for the ambulance.

Additional facts must be provided for another emergency vehicle, such as:

Vehicle(FireTruck)

EmergencyType(FireTruck)

and its relevant traffic conditions.

Therefore, the FOL structure can support simultaneous emergencies, but the current facts are insufficient to reason about a second emergency vehicle.

## **CASE STUDY 3 – AGRICULTURAL EXPERT REASONING SYSTEM**

### **Problem Statement**

An agricultural advisory agent uses a propositional knowledge base to recommend irrigation methods and determine crop risk.

### **Knowledge Base**

1. SoilDry  $\rightarrow$  IrrigationNeeded
2. IrrigationNeeded  $\wedge$  CropWheat  $\rightarrow$  ApplyDripMethod
3.  $\neg \text{ApplyDripMethod} \wedge \text{CropWheat} \rightarrow \text{CropAtRisk}$

## **Facts**

- $\text{SoilDry} = \text{True}$
- $\text{CropWheat} = \text{True}$

## **(a) Conversion into CNF**

### **P1**

$\text{SoilDry} \rightarrow \text{IrrigationNeeded}$

After eliminating implication:

**$\neg \text{SoilDry} \vee \text{IrrigationNeeded}$**

### **P2**

$\text{IrrigationNeeded} \wedge \text{CropWheat} \rightarrow \text{ApplyDripMethod}$

After eliminating implication and applying De Morgan's law:

**$\neg \text{IrrigationNeeded} \vee \neg \text{CropWheat} \vee \text{ApplyDripMethod}$**

### **P3**

$\neg \text{ApplyDripMethod} \wedge \text{CropWheat} \rightarrow \text{CropAtRisk}$

After conversion:

**$\text{ApplyDripMethod} \vee \neg \text{CropWheat} \vee \text{CropAtRisk}$**

## **Facts**

**SoilDry**

**CropWheat**

Therefore, the complete CNF is:

1.  $\neg \text{SoilDry} \vee \text{IrrigationNeeded}$
2.  $\neg \text{IrrigationNeeded} \vee \neg \text{CropWheat} \vee \text{ApplyDripMethod}$
3.  $\text{ApplyDripMethod} \vee \neg \text{CropWheat} \vee \text{CropAtRisk}$
4. **SoilDry**
5. **CropWheat**

## **(b) Resolution Refutation**

Goal:

## **ApplyDripMethod**

Negated goal:

**$\neg$ ApplyDripMethod**

From:

SoilDry

and:

$\neg$ SoilDry  $\vee$  IrrigationNeeded

we derive:

## **IrrigationNeeded**

Using:

IrrigationNeeded, CropWheat, and Rule 2:

## **ApplyDripMethod**

Now we have both:

## **ApplyDripMethod**

and:

**$\neg$ ApplyDripMethod**

Therefore, resolution produces the empty clause:

□

## **Conclusion**

**ApplyDripMethod is logically entailed by the knowledge base.**

## **(c) Removing SoilDry**

If SoilDry is removed:

- IrrigationNeeded cannot be derived.
- ApplyDripMethod cannot be derived.
- CropAtRisk cannot automatically be derived.

This is because absence of ApplyDripMethod does not mean

$\neg$ ApplyDripMethod in classical logic.

Therefore, the system must have an explicit negative fact if it wants to conclude CropAtRisk.

## **CASE STUDY 4 – WUMPUS WORLD KNOWLEDGE AGENT**

### **Problem Statement**

An AI agent operates in a Wumpus World environment. It receives percepts such as Stench, Breeze, and Glitter and uses logical inference to determine possible locations of hazards and gold.

### **Given Percepts**

- Stench at [1,2]
- Breeze at [1,1]
- Glitter at [2,2]

### **Rules**

1.  $\text{Stench}[1,2] \rightarrow \text{Wumpus is adjacent to } [1,2]$
2.  $\text{Breeze}[1,1] \rightarrow \text{Pit is adjacent to } [1,1]$
3.  $\text{Glitter}[x,y] \rightarrow \text{Gold is at } [x,y]$
4.  $\neg \text{Wumpus}[x,y] \wedge \neg \text{Pit}[x,y] \rightarrow \text{Safe}[x,y]$

### **(a) Belief State Using Modus Ponens**

From:

#### **Stench[1,2]**

the agent concludes that the Wumpus is adjacent to [1,2].

Possible Wumpus locations are:

- [1,1]
- [1,3]
- [2,2]

From:

#### **Breeze[1,1]**

the agent concludes that a Pit is adjacent to [1,1].

Possible Pit locations are:

- [1,2]
- [2,1]

From:

**Glitter[2,2]**

the agent concludes:

**Gold[2,2]**

**Belief State**

Wumpus  $\in \{[1,1], [1,3], [2,2]\}$

Pit  $\in \{[1,2], [2,1]\}$

Gold = [2,2]

### **(b) Forward Chaining**

Starting with Stench[1,2]:

**Stench[1,2]  $\rightarrow$  Wumpus adjacent to [1,2]**

Starting with Breeze[1,1]:

**Breeze[1,1]  $\rightarrow$  Pit adjacent to [1,1]**

Starting with Glitter[2,2]:

**Glitter[2,2]  $\rightarrow$  Gold[2,2]**

Thus, forward chaining allows the agent to derive the possible hazard locations and the location of the gold.

### **(c) Safety of Path**

Proposed path:

**[1,1]  $\rightarrow$  [1,2]  $\rightarrow$  [2,2]**

At [1,1], Breeze indicates that a Pit may be nearby.

At [1,2], the available knowledge does not establish that the cell is free of hazards.

At [2,2], Glitter confirms the presence of gold, but the knowledge base does not prove that the cell is free from the Wumpus or a Pit.

Therefore, the complete path cannot be logically guaranteed to be safe.

### **Conclusion**

The agent can conclude that:

**Gold is at [2,2]**

but it cannot prove that:

**[1,1]  $\rightarrow$  [1,2]  $\rightarrow$  [2,2]**

is completely safe using the available knowledge.

### **Overall Conclusion**

The four case studies demonstrate how logical reasoning techniques are applied in Artificial Intelligence.

The Smart Medical Diagnosis System uses propositional logic, forward chaining, and backward chaining to identify possible diseases. The Autonomous Traffic Management Agent demonstrates First-Order Logic, unification, and resolution for emergency vehicle routing. The Agricultural Expert System demonstrates CNF conversion and resolution refutation to derive irrigation recommendations. The Wumpus World Agent demonstrates Modus Ponens and forward chaining to reason about hazards and gold.

These examples show that knowledge-based AI agents can derive new information from existing facts and rules. However, the reliability of the conclusions depends on the completeness and correctness of the knowledge base.
